NOTE: It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

• NOTE: This is a "working draft' sequence.

• This sequence will be replaced

• This sequence will be preserved.

• This sequence will be preserved.

• The accession number will be preserved.

NOTE: It currently consists of 1 contigs Gaps between the contigs

are represented as runs of N. The order of the pieces is believed

to be correct as given, however the sizes of the gaps between them

are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is savailable and the accession number will be preserved.

Medical Center Dr. Rockville, MD 20850, USA

ON MAY 8. 2002 this sequence version replaced gi:19881808.

ONTE: This is a 'working draft' sequence. It currently

consists of 5 contigs. Gaps between the contigs

are represented as runs of N. The order of the pieces

is believed to be correct as given, however the sizes

of the gaps between them are based on estimates that have

provided by the submittor.

This sequence will be replaced

by the finished sequence as soon as it is available and

the accession number will be preserved.

                                                                                                                                                                                                                                                  The following sequence is oriented from the T7 to the SP6 end. IMPONTANT: This sequence is unfinished and does not necessarly represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the sequence may change as work continue. The sequence may be contaminated with foreign sequence from E.coli, yeast, vector, phage, etc. . even if efforts are made to eliminate these contaminating sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Submitted (06-MAR-2003) Genoscope - Centre National de Sequencage BP 191 91006 EVRY cedex - FRANCE (E-mail : segref@genoscope.cns.fr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The mucleotide sequence of this BAC clone was generated by combining Syngente and Genoscope sequencing data.

* NOTE: This is a 'working draft' sequence. It currently consists of I contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

* This sequence will be replaced

* by the finished sequence as soon as it is available and the accession number will be preserved.

* I 152159: contig of 152159 bp in length.

On May 8, 2002 this sequence version replaced gi:20146765.

**NOTE: This is a 'working draft' sequence. It currently

**consists of 7 contigs. Gaps between the contigs

**are represented as runs of N. The order of the pieces

**is believed to be correct as given, however the sizes

**of the gaps between them are based on estimates that have

**provided by the submittor.

**This sequence will be preserved.

**This sequence will be preserved.

**Py the finished sequence as soon as it is available and

**by the finished sequence as soon as it is available and

** the accession number will be preserved.

**1286: contig of 21285 bp in length

**58265: S8364: gap of unknown length

**71534: T1633: gap of unknown length

**71534: T1633: gap of unknown length

**71537: T1633: gap of unknown length

**71557: gap of unknown length

**715585: contig of 2217 bp in length

**715597: R8266: contig of 2916 bp in length

**715597: R8266: contig of 19169 bp in length

**715597: R8266: contig of 2916 bp in length

**715597: R8266: contig of 19169 bp in length

**715597: R8266: contig of 19169 bp in length

**715597: R8266: contig of 2916 bp in length

**715597: R8266: contig of 19169 bp in length

**715597: R8266: contig of 19169 bp in length

**715597: R8266: contig of 2916 bp in length

/yore= SCO(6.22, possible copper oxidase, len: 343 aa;
weakly similar to members of the multicopper oxidase
family e.g. to the N-terminus of SW:COPA PSESM
(EMBL:M1930). COPA, Pseudomonas syringae copper
resistance protein A precursor (609 aa), fasta scores;
opt: 170 z-score: 188.4 E(): 0.0036, 27.34 identity in 205
aa overlap, Also weakly similar to the blood coagulation
factors which are structurally related to the multicopper
oxidases. Similar to the N-terminus of TR:O53858
(EMBL:AL022004) Mycobacterium tuberculosis hypothetical
protein (504 aa) (25.1% identity in 323 aa overlap).
Contains PS00079 Multicopper oxidases signature 1 and
PS00080 Multicopper oxidases signature 2 (the latter

                                                                                                                                                                             The following sequence is oriented from the T7 to the SP6 end.

IMPORTANT: This sequence is unfinished and does not necessarly represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the sequence may change as work continue. The sequence may be contaminated with foreign sequence from E.coli, yeast, vector, phage, etc. . even if efforts are made to eliminate these contaminating sequences.

The nucleotide sequence of this BAC clone was generated by combining Syngents and Genoscope sequencing data.

Genes were predicted from the integrated results of the following: GENSCAN1.0, BLASTN2.0, BLASTN2.0 as well as SplicePredictor (october 1998 version). The genomic sequence was searched against (Cttp://ncbi.nlm.nih.gov/blast/db) and the cDNA sequence database at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PLN 29-MAR-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Oryza sativa (japonica cultivar-group)

RGP. Protein homologies of the coding regions were searched against the identified cDNA sequences using BLASTP2.0. ESTB represent the identified cDNA sequences using BLASTN 2.0 with the corresponding DDBJ accession no. and RGP clone ID.

A gene with identity or significant homology to a protein is classified based on the protein name to indicate the homology level such as same name, 'putative-' and 'like protein. A gene without significant homology to any protein but with EST homology (covering almost the entire length of partial sequence) is classified as an 'unknown' protein. A gene predicted with a gene prediction program is classified as a 'hypothetical' protein.

The orientation of the sequence is from T7 to SP6 of the PAC clone. This sequence of P0666G04 clone has an overlap with OJ1174_D05. This sequence of this clone starts at the position 58,198 of OJ1174_D05. This sequence of F066G04 clone has an overlap with P0489A01 (DDBJ: AP002484) clone at the position 119,689 to 141,983 of 3' end. The sequence of this clone ends at the position 19,295 of F0489A01. Detailed information on overlap and assembly quality the profession of this entry is available at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /crānslation="MQPRRRQQQQSILSFLQKKPAAAAGEEGATPERPPRPAASVA

Bacteria, Proteobacteria; Gammaproteobacteria; Pseudomonadacea; Pseudomonadacea; Pseudomonadacea; Pseudomonas.

1 (bases 1 to 2898)
Alfano, J.R., Klm, H.S., Delaney, T.P. and Collmer, A.
Evidence that the Pseudomonas syringae pv. syringae hrp-linked hrmA
gene encodes an Avr-like protein that acts in an hrp-dependent
manner within tobacco cells
MOI. Plant Microbe Interact. 10 (5), 580-588 (1997)

Petnicki-Cowieja, T., van Dijk, K. and Collmer, A.
The Pseudomonas syringae Hrp pathogenicity island has a tripartite
mosaic structure composed of a cluster of type III secretion genes
bounded by exchangeable effector and conserved effector loci that
contribute to parasitic fitness and pathogenicity in plants
Proc. Natl. Acad. Sci. U.S.A. 97 (9), 4856-4861 (2000)

Beudomonas syringae pv. syringae
Bacteria; Protebacteria; Gammaproteobacteria; Pseudomonadales;
Pseudomonadaceae; Pseudomonas.
1 (bases 1 to 723)
Alfano,J.R., Klm,H.S., Delaney,T.P. and Collmer,A.
Evidence that the Pseudomonas syringae pv. syringae hrp-linked hrmA
gene encodes an Avr-like protein that acts in an hrp-dependent
manner within tobacco cells
Mol. Plant Microbe Interact. 10 (5), 580-588 (1997)
